

OVAX-AI

Strategic Development Roadmap 2026-2028

Aligned with OVAX-AI Official Whitepaper Version 2.0 (Released 2026)

Purpose of this document

This roadmap translates the four high-level phases in the OVAX-AI Whitepaper into a practical, quarter-by-quarter operating plan. It covers product, legal data, AI engineering, security, compliance, token governance, staffing, global offices, contributor operations, partnerships, revenue readiness, and measurable release gates.

Planning horizon: Q1 2026 - Q3 2028

Document status: Strategic planning draft - not an investment solicitation

Revision note: this version updates the phase-to-calendar mapping to an accelerated, partially overlapping schedule (Foundation begun in Q1 2026; TGE and OVAX-AI V1 in Q3-Q4 2026; multi-jurisdiction Ecosystem expansion beginning Q4 2026; cross-chain deployment and governance decentralization from Q1 2027 through Q3 2028). Earlier drafts of this roadmap used a slower, fully sequential Q3 2026-Q2 2029 schedule; that version has been superseded by the timing below.

Document Control and Whitepaper Alignment

Item	Roadmap treatment
Whitepaper reference	OVAX-AI Official Whitepaper, Version 2.0, released 2026.
Core positioning	Global AI legal intelligence for digital and real-world assets; Ask -> Understand -> Connect.
Product boundaries	Legal information assistant, not a law firm; no legal advice or attorney-client relationship.
Token	\$OVAX, BEP-20, fixed supply of 100,000,000; utility and governance functions are activated only when legally and operationally ready.
Roadmap conversion	Whitepaper Phases 1-4 are mapped to an accelerated, partially overlapping calendar running from Q1 2026 through Q3 2028 (see Section 2).
Vesting interaction	The Whitepaper's M48 vesting endpoint extends beyond this roadmap. This document covers TGE through approximately M36 and identifies M48 as a post-roadmap obligation.
Governance	Progressive decentralization: core committee first, then structured community signaling, formal votes, timelock, and controlled delegation to regional entities.

Critical sequencing rule

Legal readiness, source quality, citation reliability, platform security, and jurisdictional controls take priority over token distribution, exchange listings, rapid country expansion, or public claims of legal coverage - even where Phases now run concurrently rather than strictly in sequence.

Table of Contents

- 1. Executive strategic summary
- 2. Whitepaper-to-roadmap timeline
- 3. End-of-roadmap (Q3 2028) target operating model
- 4. Global organization and office strategy
- 5. Product and platform strategy
- 6. Legal knowledge and data strategy
- 7. AI, search, citation, and evaluation strategy
- 8. Contributor and freelancer operating model
- 9. Legal professional network
- 10. Security, privacy, and compliance
- 11. Token, governance, and treasury sequencing
- 12. Commercial model and market development
- 13. Detailed roadmap: Q1 2026 - Q3 2028
- 14. Staffing plan and role progression

- 15. KPI framework and release gates
- 16. Budget architecture and capital discipline
- 17. Risk register and mitigations
- 18. End-state and post-roadmap priorities

1. Executive Strategic Summary

OVAX-AI is positioned in the Whitepaper as an AI platform that helps users understand asset-related laws, regulations, and legal risks across multiple jurisdictions, while providing a route to independent legal professionals when general information is not enough. The operating plan builds three capabilities in parallel: a trustworthy legal knowledge system, an AI product that explains and compares law without pretending to replace counsel, and an operating network that can review local content and connect users with qualified professionals.

The roadmap starts from the live Singapore Company Law MVP demonstrated in 2026. That MVP proves the deployment loop, user interface, API availability, and basic source-grounded retrieval. It does not yet prove production legal accuracy, full statutory coverage, automated updates, enterprise security, or global scale. Under the accelerated schedule below, marketing, the public TGE, and the OVAX-AI V1 release now run concurrently with the later part of Foundation-phase hardening rather than waiting for it to finish.

By Q2 2026, OVAX-AI should have completed its legal entity setup, canonical data schema, and security baseline, with private funding in place to support the legal and regulatory development strategy. By Q4 2026, OVAX-AI should have completed its public TGE and released OVAX-AI V1 - the first fully functional version of the AI-powered legal-compliance and digital-asset risk-management platform. By Q1-Q2 2027, the platform should support 12-20 production jurisdictions, AI Risk Briefing, enterprise APIs, a global contributor network, and a legal referral network. By Q3 2028, OVAX-AI should operate cross-chain infrastructure (once legal/audit requirements are met), cover 30-40 jurisdictions, and have begun transferring selected governance responsibilities to regional entities under a unified institutional framework.

Strategic objective

Build a defensible legal intelligence infrastructure - not merely a chatbot. The durable asset is the combination of verified legal data, version history, citations, editorial workflows, evaluation datasets, jurisdictional expertise, and a trusted route to licensed professionals.

1.1 Core strategic principles

- Source before synthesis: The AI may explain only after the platform has identified relevant official or approved sources.
- Jurisdiction before generalization: Every answer must declare the jurisdiction, legal scope, and effective-date context.
- Evidence before confidence: Confidence indicators must be derived from source quality, retrieval quality, coverage, and review status.
- Human review where impact is high: High-risk topics, public legal modules, and country launch gates require qualified editorial or legal review.
- Product truth over marketing speed: Coverage claims must match what is actually indexed, tested, and maintained - including under the faster, overlapping schedule.
- Progressive decentralization: Governance and token functionality expand only after technical, legal, treasury, and community controls are ready.

- Regional ownership, global standards: Country contributors own local accuracy while the central platform enforces common schemas, evaluation, and audit trails.

1.2 Planning assumptions

- The official planning period begins in Q1 2026 and ends in Q3 2028.
- London, San Francisco, and Singapore are treated as planned principal operating hubs. Each begins with approximately 3-5 staff and expands only when product and revenue milestones justify growth.
- Additional jurisdictions use a distributed model: local editors, subject-matter contributors, partner law firms, and specialist freelancers working through structured forms and review workflows.
- The company avoids representing AI-generated information as legal advice and maintains clear product boundaries consistent with the Whitepaper.
- Public token-related milestones (including the accelerated Q3-Q4 2026 TGE window) remain conditional on legal, technical, market-integrity, and operational readiness. This roadmap does not guarantee a TGE, exchange listing, price, liquidity, or return.
- The token vesting schedule may continue beyond this operational roadmap; M48 obligations remain governed by the Whitepaper and applicable contracts.

2. Whitepaper-to-Roadmap Timeline

The Whitepaper groups development into four phases: Foundation; Mainnet and TGE; Ecosystem; and Maturity. The mapping below reflects an accelerated, partially overlapping operating calendar: Phase 2 (Mainnet and TGE) and the early part of Phase 3 (Ecosystem) now run concurrently with the later part of Phase 1 (Foundation), rather than waiting for Foundation to close out first.

Whitepaper phase	Operational timing	Detailed interpretation
Phase 1 - Foundation	Q1 2026 - Q2 2027	Establish the project's legal entity and operational framework. Complete the data schema and security standards for each ecosystem. Primary focus during this window is securing private funding to support the project's legal and regulatory development strategy.
Phase 2 - Mainnet and TGE	Q3 2026 - Q4 2026 (runs concurrently with the later part of Phase 1)	Launch the project's marketing initiatives, conduct the public Token Generation Event (TGE), and officially release OVAX-AI V1 - the first fully functional version of the AI-powered legal-compliance and digital-asset risk-management platform.
Phase 3 - Ecosystem	Q4 2026 - Q1 2027 (overlaps the close of Phase 1 and Phase 2)	Expand operations across multiple jurisdictions. Complete development of AI Risk Briefing - an AI-powered risk analysis and early-warning system - and launch enterprise-grade APIs for the financial services and digital-asset industries. Build a global contributor network across partner ecosystems while establishing a legal referral network. Objective: production deployment in 12-20 jurisdictions.
Phase 4 - Maturity	Q1 2027 - Q3 2028 onward	Deploy cross-chain infrastructure once participating enterprises have satisfied all applicable legal, regulatory, and audit requirements. Expand operations to 30-40 jurisdictions while

		strengthening compliance monitoring and regulatory oversight across the ecosystem. Gradually decentralize governance by transferring selected governance responsibilities to regional entities worldwide, through a phased approach, under a unified institutional governance framework and standardized operational policies.
--	--	--

Note: because Phases 2 and 3 are no longer strictly sequential after Phase 1, Section 13 presents the operating detail quarter by quarter so overlapping workstreams remain visible and gated individually.

Interpretation of the Whitepaper's '40+ jurisdictions'

The phrase should be divided into coverage tiers. Over the life of this roadmap, OVAX-AI may monitor or catalogue more than 40 jurisdictions, but only jurisdictions that pass source, review, evaluation, update, and support gates should be marketed as production-grade coverage.

2.1 Coverage tier definitions

Tier	Meaning	Public claim allowed
Tier 0 - Monitored	Sources identified; update monitoring or research underway; not available for user answers.	No country-coverage claim.
Tier 1 - Indexed	Primary sources indexed; basic retrieval available; incomplete editorial validation.	Research preview only.
Tier 2 - Reviewed	Core topic coverage reviewed; citations, dates, and known limitations documented.	Beta coverage with clear limitations.
Tier 3 - Production	Automated update monitoring, evaluation thresholds, local reviewer, incident process, and user support active.	Full supported-jurisdiction claim.
Tier 4 - Professional Network	Production coverage plus verified referral partners and structured escalation.	Ask -> Understand -> Connect available.

3. End-of-Roadmap (Q3 2028) Target Operating Model

At the end of this roadmap, OVAX-AI should function as a coordinated platform rather than a single application. The operating model combines central engineering and governance with regional legal-data operations and a distributed contributor network.

Capability	2026 starting point	Q3 2028 target
Legal data	Small curated Singapore demo dataset	Structured, versioned, continuously monitored corpus across 30-40 production jurisdictions, with 40+ additional monitored or indexed jurisdictions.
AI answering	Simple retrieval and optional LLM synthesis	Hybrid search, citation-first generation, answer decomposition, risk detection, multilingual output, abstention, and evaluation dashboards.
User product	Single public demo page	Consumer, professional, and enterprise workspaces; saved research; reports; jurisdiction comparison; document review assist; referral escalation.
Editorial operations	Manual JSON updates	Contributor portal, reviewer queues, source verification, change detection, issue management, version history, and country dashboards.
Professional network	Concept stage	Verified independent lawyer network in priority jurisdictions, with conflict and consent controls.
Security and compliance	Basic hosted MVP	Audited cloud controls, privacy operations, vendor management, incident response, data classification, and enterprise security documentation.
Governance	Core team decisions	Progressive governance with defined reserved matters, proposal thresholds, timelocks, treasury reporting, and phased delegation to regional entities.

3.1 Product families by end of roadmap

- OVAX Legal Search: source-grounded answers with jurisdiction, effective date, and citations.

- OVAX Risk Briefing: structured legal-risk summaries for asset, company, transaction, and compliance questions.
- OVAX Jurisdiction Compare: side-by-side comparison of legal treatment, obligations, and uncertainty.
- OVAX Document Review Assist: issue spotting and source-linked review prompts, explicitly not a substitute for professional review.
- OVAX Professional Connect: referral and introduction workflow for independent licensed professionals.
- OVAX Enterprise API: legal retrieval, comparison, monitoring, and citation services for regulated or asset-focused businesses.
- OVAX Contributor Studio: structured submission, review, versioning, and quality scoring for global legal content.

4. Global Organization and Office Strategy

The three planned offices should not duplicate full departments. Each hub should own a distinct operating mandate while sharing common engineering, security, editorial, and compliance standards.

Hub	Planned address	Primary mandate	Staffing direction
London	Charing Cross Rd, London SW1A 2BN, England	Group strategy, legal product policy, UK/EU editorial standards, governance, institutional partnerships, communications.	Initial 3-5; target 8-12 by Q3 2028.
San Francisco	3488 20th St, San Francisco, CA 94110, USA	AI engineering, search and evaluation, platform architecture, developer ecosystem, US market development.	Initial 3-5; target 10-16 by Q3 2028.
Singapore	5 Coronation Dr, Singapore	Asia operations, Singapore legal corpus, regional contributors, APAC partnerships, customer operations, data-quality coordination.	Initial 3-5; target 8-14 by Q3 2028.

Address and entity disclosure

Public materials should distinguish clearly between a registered office, an operating office, a mailing address, and a planned location. The company should publish only addresses that it is legally entitled to use and should avoid implying a staffed office where no operating presence exists.

4.1 Initial office composition

Office	Suggested first 3-5 roles
London	Managing Director / CEO office; Legal Product Lead; Compliance and Policy Manager; Partnerships Lead; Operations Coordinator.
San Francisco	CTO or Principal Engineer; AI/Search Engineer; Backend/Platform Engineer; Evaluation/MLOps Engineer; Developer Relations or Product Designer.
Singapore	APAC Lead; Singapore Legal Data Editor; Full-stack or Data Engineer; Contributor Operations Manager; Partnerships/Customer Success.

4.2 Distributed country model

Countries outside the three core hubs should begin as virtual country cells. A country cell is not necessarily a legal entity or office. It is an operating unit consisting of one country editor, one or more subject contributors, and access to an independent qualified reviewer where necessary.

Role	Responsibility	Engagement model
Country Editor	Owns source map, topic taxonomy, update calendar, contributor quality, known limitations, and launch readiness.	Part-time, contractor, or employee depending on volume.
Legal Contributor	Creates structured summaries, source annotations, change notes, FAQs, and test questions using approved forms.	Freelancer or specialist contractor.
Qualified Reviewer	Reviews high-impact modules, legal accuracy, and referral boundaries; does not automatically become platform counsel.	Independent lawyer, firm, or specialist advisor.
Language Reviewer	Checks legal terminology and user-facing translations against source meaning.	Freelance linguist with legal-domain experience.
Regional Operations Lead	Coordinates multiple country cells, escalations, launch gates, and service levels.	Employee in a principal hub.

5. Product and Platform Strategy

The product strategy follows the Whitepaper's Ask -> Understand -> Connect model. Each stage becomes a distinct product capability with explicit quality and safety controls.

Stage	User experience	System requirement	Release gate
Ask	User describes a question in plain language and selects or confirms jurisdiction.	Intent detection, jurisdiction resolution, topic classification, language detection, and risk screening.	At least 95% correct jurisdiction/topic routing on benchmark set.
Understand	User receives a structured explanation, relevant rules, sources, dates, limitations, and next steps.	Hybrid retrieval, legal metadata, citation validation, synthesis constraints, abstention, and confidence scoring.	Citation precision and answer-support threshold reached for each jurisdiction.
Connect	User may request an introduction when the issue requires professional judgment.	Professional directory, consent, conflict-aware routing, eligibility checks, and referral audit trail.	Verified professionals, documented terms, and jurisdiction-specific referral compliance.

5.1 Product release sequence

Release	Definition
R0 - Demo	Public MVP with small curated dataset and visible experimental status.
R1 - Research Preview	Expanded official-source corpus; user accounts; saved questions; basic citations; no high-impact workflows.
R2 - Controlled Beta	Selected users; reviewed coverage; evaluation dashboard; incident reporting; strict usage limits.
R3 - General Availability	Production jurisdictions only; billing; support; privacy controls; operational SLAs.
R4 - Professional	Advanced comparison, document review assist, team workspaces, exports, and professional referrals.
R5 - Enterprise	API, private knowledge integration, audit logs, SSO, contractual security commitments, and monitoring.

5.2 User-interface priorities

- Always show selected jurisdiction and allow the user to correct it.
- Display sources with title, authority, section, effective date, retrieval date, and official link.

- Separate legal rule, plain-language explanation, practical considerations, uncertainty, and recommended escalation.
- Provide an explicit 'not enough reliable information' response rather than filling gaps.
- Allow users to report a source error, outdated law, misleading answer, or missing jurisdiction.
- Use clear labels for experimental, beta, reviewed, and production coverage.
- Do not show hidden reasoning traces; show concise evidence and source summaries instead.

6. Legal Knowledge and Data Strategy

The legal knowledge base is the principal strategic asset. It must be designed as a versioned evidence system rather than a collection of documents. Every answerable legal unit needs source provenance, jurisdiction, topic, dates, status, and review history.

6.1 Canonical legal record

Field group	Required information
Identity	Jurisdiction; authority; instrument type; act/regulation/guidance name; part; division; section; subsection; unique source identifier.
Temporal metadata	Publication date; commencement/effective date; amendment date; repeal/supersession status; retrieval date; next review date.
Content	Official text or permitted extract; normalized text; plain-language summary; key obligations; exceptions; penalties; definitions.
Source and rights	Official URL; source type; access terms; permitted storage/use; hash or snapshot reference.
Editorial	Contributor; reviewer; review status; confidence; known limitations; issue tickets; version history.
Retrieval	Topics; entities; asset types; user intents; language; embeddings; keywords; cross-references.

6.2 Data-source hierarchy

- Priority 1: official legislation, regulators, government agencies, courts, and gazettes.
- Priority 2: official explanatory notes, filing guidance, regulator FAQs, and public enforcement notices.
- Priority 3: licensed or permissioned secondary sources, professional commentary, and structured partner material.
- Priority 4: contributor explanations used only after source verification and never as the sole basis for high-impact answers.

6.3 Country launch pipeline

Gate	Deliverable	Owner
G0 - Source map	List of official sources, authorities, languages, update channels, access rights, and priority topics.	Country Editor
G1 - Schema ingestion	Documents parsed into canonical records; links, dates, sections, and hashes validated.	Data Engineering
G2 - Editorial review	Core summaries, exceptions,	Country Editor / Reviewer

	limitations, and terminology reviewed.	
G3 - Evaluation	Country benchmark questions scored for retrieval, citation, completeness, and abstention.	Evaluation Team
G4 - Operational readiness	Update monitor, incident owner, support notes, and review calendar live.	Regional Operations
G5 - Public launch	Coverage tier approved; marketing language and user labels match actual scope.	Release Committee

6.4 Update and change-management model

A jurisdiction is not production-ready merely because documents were imported once. Each production jurisdiction requires active change detection and a documented response process.

- Monitor official feeds, gazettes, regulator update pages, document hashes, sitemap changes, and selected newsletters.
- Create a change event when text, effective date, guidance, or status changes.
- Classify change severity: informational, material, urgent, or service-impacting.
- Temporarily downgrade affected modules when the change cannot be reviewed within the required service level.
- Re-run retrieval and answer benchmarks after each material change.
- Keep previous versions so users and enterprise customers can understand what the platform knew at a given time.

7. AI, Search, Citation, and Evaluation Strategy

The AI layer should be constrained by the legal evidence layer. Model quality alone cannot compensate for weak source coverage, outdated law, or incorrect jurisdiction selection.

7.1 Target answer pipeline

Step	Layer	Function
1	Intake	Detect language, jurisdiction, user intent, topic, asset type, and whether personal facts create a high-impact scenario.
2	Scope	Resolve or ask for missing jurisdiction, date, entity type, transaction type, and user role.
3	Retrieve	Run lexical, semantic, metadata, citation-network, and authority-aware search.
4	Rank	Prioritize official, effective, reviewed, and directly applicable sources.
5	Validate	Check citations, source status, temporal fit, and contradictions.
6	Generate	Produce a structured explanation only from validated evidence.
7	Risk control	Apply abstention, uncertainty, professional-escalation, and prohibited-claim rules.
8	Present	Show answer, jurisdiction, sources, effective dates, confidence, limitations, and next steps.
9	Learn	Capture feedback, incidents, failed queries, and benchmark candidates without silently training on sensitive user data.

7.2 Evaluation framework

Metric	What it measures	Illustrative production target
Jurisdiction routing	Correctly identifies the applicable country/region or asks for clarification.	$\geq 95\%$ on supported benchmark.
Retrieval recall	Relevant controlling or primary source appears in top results.	$\geq 90\%$ on core-topic gold set.
Citation precision	Cited sources actually support	$\geq 95\%$ for reviewed modules.

	the sentence or conclusion.	
Temporal accuracy	Uses effective law and flags future, repealed, or superseded material.	>=98% on dated benchmark.
Completeness	Covers main rule, material exception, obligation, and limitation.	Threshold by topic risk tier.
Abstention quality	Refuses or narrows when evidence is insufficient or outside scope.	>=90% correct abstention.
Professional escalation	Identifies when licensed advice is needed without over-referring routine information.	Reviewed by legal-product team.
User comprehension	Users understand the answer and source relationship.	Measured through task tests.

7.3 Model and infrastructure principles

- Remain model-agnostic; use a routing layer so multiple commercial or open models can be evaluated.
- Separate retrieval, citation validation, generation, safety, and presentation services.
- Store prompts, model versions, source sets, and answer traces needed for audit - but not hidden chain-of-thought.
- Use smaller models for classification and extraction; reserve larger models for complex synthesis.
- Cache safe, source-versioned answers where appropriate, while invalidating them after legal changes.
- Support regional data processing and enterprise isolation as the customer base expands.
- Run red-team tests for hallucinated sections, invented penalties, wrong jurisdictions, outdated dates, and unauthorized legal advice claims.

8. Contributor and Freelancer Operating Model

A global contributor network allows OVAX-AI to scale legal content without building full offices in every jurisdiction. The network must operate through forms, defined evidence requirements, reviewer separation, and measurable contributor quality.

8.1 Contributor submission form

Section	Required fields
Contributor identity	Verified name, country, professional background, conflicts, tax/payment information, confidentiality agreement.
Source	Official authority, title, URL, publication/effective dates, document type, access date, language.
Legal unit	Jurisdiction, topic, section, rule, exception, obligation, penalty, defined terms, affected user/entity types.
Plain-language content	Summary, examples, common misunderstanding, when professional advice is needed.
Change status	New, amended, repealed, superseded, clarification, enforcement development.
Evidence	Quoted or linked supporting passage, section reference, screenshot/hash where permitted.
Quality declaration	Original work, source verified, no undisclosed automated generation, limitations disclosed.

8.2 Three-layer review

Layer	Reviewer	Purpose
Layer 1 - Technical validation	Platform rules and automated checks	Required fields, valid URLs, duplicates, date consistency, section identifiers, source authority, and formatting.
Layer 2 - Country editorial review	Country Editor	Correct topic mapping, source relevance, plain-language accuracy, limitations, and consistency.
Layer 3 - Qualified review	Independent lawyer or approved specialist	Required for high-risk modules, penalties, licensing, enforcement, investment, tax, sanctions, or public launch.

8.3 Contributor scoring and incentives

- Quality score: accuracy, source quality, reviewer corrections, completeness, and timeliness.
- Reliability score: response to revision requests, update performance, conflict disclosure, and adherence to templates.

- Domain score: topic-specific strength rather than a single universal rank.
- Payment: primarily fiat or contract fees during early years; token-denominated grants only where lawful, documented, and operationally appropriate.
- Penalties: rejected submissions, plagiarism, fabricated sources, undisclosed conflicts, or repeated low-quality work reduce access or terminate the relationship.
- Recognition: verified profiles, contributor levels, country badges, and publication credits where compatible with privacy and professional rules.

9. Independent Legal Professional Network

The Whitepaper states that OVAX-AI will connect users with independent legal professionals when expert assistance is required. This network should be built gradually and should remain legally distinct from the AI information product.

9.1 Verification standard

- Identity and current professional license verified directly or through a reliable registry.
- Jurisdiction, practice area, languages, and disciplinary status recorded.
- Terms clearly state that professionals are independent and that OVAX-AI does not direct professional judgment.
- Referral fees, advertising, fee-sharing, and lead-generation rules checked by jurisdiction.
- Conflict checks, engagement letters, fees, and attorney-client relationship remain the professional's responsibility unless a compliant workflow is specifically implemented.
- User consent is obtained before information is transferred.

9.2 Rollout

Stage	Coverage	Functionality
Pilot	Singapore and England/Wales	Small verified panel; manual introductions; measured response times.
Regional	Priority US states, Hong Kong, UAE, Australia, selected EU countries	Structured referral requests, routing by topic and language.
Network	Production jurisdictions	Directory, availability, introduction tracking, feedback, and service-quality monitoring.
Enterprise	Specialist firms and panels	Organization referrals, multi-country matters, agreed service levels, and private workflows.

10. Security, Privacy, and Compliance

Security and privacy must mature in step with product capability. The platform will process legal questions that may reveal business plans, assets, transactions, disputes, and personal circumstances.

10.1 Security roadmap

Period	Security priorities
Q1 2026 - Q4 2026	Secure software development lifecycle; secrets management; dependency scanning; least privilege; encrypted transport and storage; backups; audit logging; incident response plan; penetration test before the Q3-Q4 2026 TGE and V1 general availability.
2027	Enterprise identity, SSO, role-based access, tenant isolation, vendor risk management, data retention controls, formal threat modeling, annual penetration tests, security questionnaire package.
2028	SOC 2 or equivalent readiness/audit pathway; regional processing controls; business continuity exercises; advanced detection; independent assessment of AI and data pipelines - including the cross-chain components introduced under Phase 4.

10.2 Privacy operations

- Collect only information needed for the user-requested function.
- Do not require identity for basic public research unless legally or operationally necessary.
- Provide access, correction, deletion, export, consent, and complaint processes appropriate to applicable regimes.
- Separate product analytics from legal-question content where possible.
- Define retention periods for chat history, uploaded documents, referrals, logs, and enterprise data.
- Do not use confidential customer content for model training without explicit, informed contractual permission.
- Document international data transfers and processor/subprocessor relationships.

10.3 Legal product boundaries

Mandatory product language

OVAX-AI provides legal information and research assistance. It is not a law firm, does not provide legal advice, does not represent users, does not guarantee outcomes, and does not create an attorney-client relationship. Users should consult a licensed professional for decisions requiring advice specific to their facts.

11. Token, Governance, and Treasury Sequencing

The Whitepaper defines \$OVAX as a fixed-supply utility and governance token with platform, staking, governance, referral, legal-module, and grant functions. Under the accelerated schedule, token functions activate earlier than in a fully sequential plan, but only after the readiness gates below are met.

11.1 Readiness gates before any public TGE

- Independent legal analysis covering issuance, marketing, distribution, platform use, referral rewards, staking, governance, treasury, sanctions, and target jurisdictions.
- Verified and published smart-contract source code; independent audit; ownership/admin-power disclosure; treasury and multisignature controls.
- Accurate token allocation, vesting contracts, circulating-supply reporting, and conflict disclosures.
- Working product utility that is not merely speculative or promised.
- Market-integrity, liquidity, exchange, and communications policies.
- Risk disclosures, eligibility controls, sanctions screening, prohibited-jurisdiction controls, and complaint processes.
- Board or governance approval using a documented readiness report.

11.2 Indicative token timeline aligned to operations

Period	Operational treatment
Q1 2026 - Q2 2026	Foundation groundwork: contract testing, audits, legal analysis, treasury design, utility prototyping, and disclosures, prepared ahead of the accelerated public-TGE window.
Q3 2026 - Q4 2026	Public TGE window. Marketing launch, public Token Generation Event, and release of OVAX-AI V1, conditional on all readiness gates in 11.1 being satisfied; may be delayed without affecting the rest of the roadmap.
Q4 2026 - Q1 2027	Activate utility functions supported by real product use: subscription credits, grants, contributor incentives, and governance signaling, in step with multi-jurisdiction expansion and enterprise API rollout.
2027	Continue utility activation; staking activated only if legally and economically justified.
Q1 2027 - Q3 2028	Cross-chain infrastructure deployed once legal, regulatory, and audit requirements are satisfied; expand governance scope cautiously with phased delegation to regional entities; publish treasury and token-utility reporting.
Post-roadmap to M48	Continue vesting and reporting obligations. Whitepaper allocation schedules extending to M48 remain outside this operating plan.

11.3 Progressive governance

Stage	Decision rights
Foundation	Core committee controls security, legal, treasury, employment, contracts, and emergency actions; community feedback is advisory.
Signaling	Token holders and users can submit and rank product, grants, and ecosystem proposals.
Limited on-chain governance	Defined non-reserved matters, quorum, voting window, timelock, conflict rules, and emergency pause.
Mature governance	Expanded grants, selected treasury allocations, parameter changes, and representative regional councils; reserved legal and fiduciary matters remain protected.

12. Commercial Model and Market Development

Commercial development should begin with paid research and workflow value, not token speculation. Revenue validates product-market fit and supports continued legal-data maintenance.

12.1 Product tiers

Tier	Target user	Core offer
Free / Public	Individuals exploring general questions	Limited searches, public sources, basic citations, production jurisdictions only.
Pro	Founders, investors, asset owners, consultants	More queries, saved research, reports, comparisons, risk briefings, alerts.
Professional	Lawyers, accountants, compliance consultants	Advanced search, source history, team workspaces, document review assist, exports.
Enterprise	Platforms, financial services, asset businesses, large firms	API, SSO, private workspaces, audit logs, custom jurisdictions, monitoring, support.
Partner	Law firms, regulators, associations, education providers	Co-developed modules, verified directories, data partnerships, or white-label workflows.

12.2 Market-entry sequence

- Singapore company and digital-asset legal information: prove source-grounded quality and regional operations.
- UK company, financial promotion, digital asset, and ownership modules: leverage London legal-product leadership.
- US federal plus selected state coverage: narrow scope initially; avoid implying one national answer where state law controls.
- Hong Kong, UAE, Australia, and selected EU jurisdictions: choose based on user demand, source accessibility, partners, and editorial capacity.
- Enterprise monitoring and API: sell once coverage quality, uptime, privacy, and auditability meet procurement requirements.

13. Detailed Roadmap: Q1 2026 - Q3 2028

The blocks below follow the accelerated, overlapping calendar in Section 2. Where Phase 2 (Mainnet and TGE) and Phase 3 (Ecosystem) run concurrently with the end of Phase 1 (Foundation), the affected quarter blocks list workstreams from both phases side by side rather than treating them as sequential.

Q1 2026 - Q2 2026 - Foundation setup

Phase 1 - Foundation

Workstream	Quarter deliverable
Product	Stabilize the Singapore demo; add clear jurisdiction/status labels; improve source display; create an issue-reporting flow.
Legal data	Define the canonical legal schema; build the Singapore source map; import Companies Act and ACRA priority guidance into versioned records.
AI and engineering	Implement a hybrid lexical/semantic retrieval prototype; citation object model; baseline abstention rules.
Organization	Confirm group structure and planned hub responsibilities; appoint product, engineering, legal-data, and operations owners.
Legal, privacy, security	Publish product boundary language; data inventory; privacy notice draft; contributor and vendor agreements.
Legal entity and funding	Establish the project's legal entity and operational framework; begin securing private funding to support the legal and regulatory development strategy.
Quarter-end evidence / KPI	500-1,000 curated legal records; 100 benchmark questions; legal entity formed; private-funding process underway.

Q3 2026 - Q4 2026 - Marketing launch, public TGE, and OVAX-AI V1

Phase 1 (continuing) + Phase 2 - Mainnet and TGE

Workstream	Quarter deliverable
Product	Release OVAX-AI V1 - the first fully functional version of the AI-powered legal-compliance and digital-asset risk-management platform; user accounts; saved questions; answer feedback.
Marketing and token	Launch public marketing initiatives; conduct the public Token Generation Event (TGE), conditional on the readiness gates in 11.1.
Legal data	Expand Singapore company-law topics:

	directors, secretary, registered office, shares, filings, records, beneficial ownership, strike-off basics.
AI and engineering	Retrieval ranking; source authority weighting; answer templates; citation support checks; model comparison.
Organization	Initial 3-5 staff per hub; Singapore contributor pilot; recruit first country editor and reviewers.
Legal, privacy, security	Security baseline; incident process; source-use review; smart-contract audit and legal opinions completed ahead of TGE.
Quarter-end evidence / KPI	OVAX-AI V1 released; TGE completed or documented delay; 300+ benchmark questions; >=85% source recall on core topics; 25-50 controlled beta users.

Q1 2027 - Q2 2027 - Multi-jurisdiction expansion and Ecosystem build-out

Phase 1 (closing) + Phase 3 - Ecosystem

Workstream	Quarter deliverable
Product	Controlled beta; research history; structured answer sections; enterprise workspace alpha; alerts.
Legal data	Reusable HTML/PDF parser framework; change detection; editorial review queues; launch reviewed modules for a demand-led set of new jurisdictions.
AI and engineering	Complete AI Risk Briefing (AI-powered risk analysis and early-warning system); jurisdiction clarification; effective-date checks; contradiction detection.
Enterprise APIs	Launch enterprise-grade APIs tailored for financial-services and digital-asset businesses; API documentation; first enterprise design partners.
Contributor and referral network	Build a global contributor network across partner ecosystems; launch the legal referral network; contributor portal beta.
Organization	London, San Francisco, and Singapore cells operational; regional country cells; contributor quality operations.
Legal, privacy, security	Penetration-test preparation; retention policy; access control; referral compliance by active jurisdiction.
Quarter-end evidence / KPI	Progress toward 12-20 production jurisdictions; 100+ beta/enterprise users; enterprise API in alpha/beta; contributor network live.

Q3 2027 - Q4 2027 - Jurisdiction scaling and governance signaling

Phase 3 (continuing) + early Phase 4 - Maturity

Workstream	Quarter deliverable
Product	Professional workspace GA candidate; jurisdiction comparison; document review assist alpha.
Legal data	Reach the 12-20 production-jurisdiction target; pipeline toward 30-40 jurisdictions; standardized country launch kits.
AI and engineering	Authority-aware ranking; multilingual retrieval; confidence calibration; automated regression evaluation after legal updates.
Organization	Regional Operations Leads; verified professional onboarding; global editorial council forming.
Legal, privacy, security	Enterprise DPA/security package; vendor risk program; legal opinions and audits for cross-chain readiness.
Governance	Governance signaling stage: token holders and users can submit and rank product, grants, and ecosystem proposals.
Quarter-end evidence / KPI	12-20 production jurisdictions reached; 50-100 verified professionals; governance signaling live.

Q1 2028 - Q2 2028 - Cross-chain deployment and continued jurisdiction growth

Phase 4 - Maturity

Workstream	Quarter deliverable
Product	Institutional suite alpha; advanced monitoring; private organization knowledge connectors.
Legal data	Expand toward 30-40 production/reviewed jurisdictions; 40+ monitored/indexed pipeline; coverage-quality dashboard.
AI and engineering	Cross-border obligation mapping; scenario comparison; documented model-risk controls.
Cross-chain infrastructure	Deploy cross-chain infrastructure once participating enterprises have satisfied all applicable legal, regulatory, and audit requirements.
Organization	Expand all three hubs based on revenue; formal regional councils and escalation paths.
Legal, privacy, security	Independent control review; business continuity exercise; governance reserved-

	matters framework; SOC 2 or equivalent readiness.
Quarter-end evidence / KPI	25 enterprise customers; 30 supported jurisdictions; cross-chain infrastructure live in at least one audited environment.

Q3 2028 - Governance decentralization and roadmap close-out

Phase 4 - Maturity (governance handover)

Workstream	Quarter deliverable
Product	Unified consumer, professional, enterprise, contributor, and referral platform.
Legal data	30-40 production jurisdictions with active review; 50+ monitored/indexed pipeline where feasible.
AI and engineering	Mature evaluation, calibrated confidence, multilingual operation, and source-versioned answer reproducibility.
Governance decentralization	Gradually transfer selected governance responsibilities to regional entities worldwide, through a phased approach, under a unified institutional governance framework and standardized operational policies.
Organization	London 8-12; San Francisco 10-16; Singapore 8-14; global employee/contractor network with clear accountability.
Legal, privacy, security	Publish a roadmap-period transparency report; assess further cross-chain expansion, additional decentralization, and new markets based on evidence.
Quarter-end evidence / KPI	Roadmap review completed; post-2028 plan approved; token M48 obligations and continued governance evolution separately tracked.

14. Staffing Plan and Role Progression

Staff growth should follow release gates and recurring revenue. The following numbers are planning ranges, not commitments. They include employees but exclude most part-time country contributors and law-firm partners.

Period	London	San Francisco	Singapore	Other employees	Core total
Q1-Q2 2026	2-3	2-3	2-3	0-1	6-10
Q3-Q4 2026	3-5	3-5	3-5	0-3	9-18
Q1-Q2 2027	4-6	5-8	4-7	2-5	15-26
Q3-Q4 2027	5-8	7-11	5-8	4-8	21-35
Q1-Q2 2028	6-10	8-14	6-11	8-20	28-55
Q3 2028	8-12	10-16	8-14	12-28	38-70

14.1 Functional team targets by Q3 2028

Function	Indicative core roles
Leadership and operations	CEO/MD, COO, CFO/finance, regional leads, program management, board/governance support.
Engineering	Platform, backend, frontend, data, search, MLOps, DevOps/SRE, QA, security engineering.
AI and evaluation	Applied AI, retrieval, evaluation, red-team, model-risk and cost optimization.
Legal product and editorial	Legal Product Lead, regional legal editors, taxonomy, content operations, review managers.
Security, privacy, compliance	Security lead, privacy/compliance, vendor risk, incident and enterprise assurance.
Commercial	Enterprise sales, partnerships, customer success, developer relations, communications.
Contributor operations	Onboarding, verification, payment, quality scoring, country-cell management.

14.2 Hiring order

- 1. First: senior technical owner, legal-product owner, data/editorial owner, and operations/compliance owner.
- 2. Second: engineers who can build reusable ingestion, retrieval, evaluation, and admin workflows.
- 3. Third: country editors and review capacity for jurisdictions selected by real demand.
- 4. Fourth: commercial and enterprise roles after product evidence and support capacity exist.
- 5. Fifth: management layers only when team size and operational complexity require them.

15. KPI Framework and Release Gates

15.1 Company-level scorecard

Dimension	Core KPI examples
Trust	Citation precision; update SLA; critical error rate; correction time; production coverage accuracy.
Product	Successful research tasks; active users; retention; paid conversion; saved reports; comparison usage.
Data	Reviewed records; source freshness; jurisdictions by tier; unresolved change events; reviewer throughput.
AI	Retrieval recall; abstention; temporal accuracy; cost per answer; latency; benchmark regression.
Network	Verified professionals; referral acceptance; response time; user satisfaction; country contributor coverage.
Security/privacy	Incidents, vulnerability closure, access reviews, deletion requests, vendor risk status.
Commercial	Recurring revenue, enterprise pipeline, gross margin, support cost, revenue concentration.
Governance/token	Treasury reporting, proposal participation, vesting accuracy, utility usage, compliance incidents.

15.2 No-go release conditions

- The platform cannot reliably identify the jurisdiction or effective date.
- Sources do not support the displayed answer or citations are fabricated/misaligned.
- A jurisdiction lacks an accountable editor and update process.
- Critical security findings remain unresolved.
- Marketing claims exceed actual production coverage.
- A token, referral, or professional-network feature lacks required legal and operational controls.
- The team cannot support incident response, user correction, or data deletion.

16. Budget Architecture and Capital Discipline

A detailed financial model should be prepared separately using actual salary, contractor, office, cloud, insurance, legal, and licensing quotes. The roadmap uses percentage allocation bands so the plan remains realistic across funding scenarios.

Cost category	Year 1 planning band	Year 2 planning band	Year 3 (partial) planning band
Engineering and AI	35-45%	30-40%	25-35%
Legal data and reviewers	15-25%	20-30%	20-30%
Security, privacy, legal and audit	10-18%	10-16%	10-16%
Cloud, models, tooling and data licenses	8-15%	10-18%	12-20%
Commercial, partnerships and support	5-12%	10-20%	15-25%
Operations, finance and offices	8-15%	8-15%	8-15%

16.1 Capital rules

- Maintain at least 12 months of operating runway under the approved hiring plan.
- Do not treat token treasury value as guaranteed operating cash.
- Separate user funds, token treasury, company operating accounts, and liquidity arrangements.
- Require milestone evidence before opening new offices or adding major country programs.
- Measure model and cloud cost per successful user task, not only per API call.
- Prefer reusable ingestion and evaluation infrastructure over one-off country builds.

17. Risk Register and Mitigations

Risk	Priority	Primary mitigations
Legal misinformation	High	Citation-first design; reviewed modules; abstention; incident correction; professional escalation.
Outdated law	High	Automated monitoring; country owner; severity classification; temporary downgrade; version history.
Unauthorized legal practice claims	High	Product language, interface boundaries, staff training, jurisdictional review, referral separation.
Token/regulatory risk	High	Independent legal advice; eligibility controls; disclosures; treasury governance - especially important given the accelerated TGE window.
Security breach	High	Secure SDLC, least privilege, encryption, testing, monitoring, incident plan, enterprise controls.
Data licensing/source restrictions	Medium-High	Source rights register; official sources first; permissioned datasets; deletion/replacement process.
Contributor fraud or plagiarism	Medium-High	Identity verification, source evidence, originality declarations, scoring, reviewer separation.
Model vendor dependence	Medium	Model abstraction, multi-provider testing, caching, cost controls, open-model contingency.
Premature global expansion	High	Coverage tiers; launch gates; demand-led countries; central standards; regional ownership.
Referral-network misconduct	High	License verification, independent status, jurisdiction-specific terms, complaint and removal process.
Governance capture	Medium-High	Quorum, delegation rules, timelock, conflict policy, reserved matters, transparency reporting.
Compressed/overlapping	High	Because Phases 2 and 3 now

schedule risk		run concurrently with Phase 1, explicit go/no-go gates (Section 15.2) apply independently to each overlapping workstream so schedule pressure cannot substitute for readiness.
Reputation risk	High	Truthful coverage claims, rapid corrections, public transparency reports, no fabricated credentials/offices.

18. End-State and Post-Roadmap Priorities

At Q3 2028, OVAX-AI should be judged by evidence rather than ambition. The project succeeds if users can obtain clearer, source-linked, jurisdiction-aware legal information; if unsupported questions are safely narrowed or refused; if legal changes are detected and reviewed; if independent professionals can be reached when needed; and if the organization can operate this system securely across regions.

18.1 Expected end-state

- 30-40 production or reviewed jurisdictions with accountable update operations, plus a larger monitored/indexed pipeline.
- A global legal knowledge platform with versioned sources, editorial history, and reproducible answers.
- Consumer, professional, enterprise, contributor, and referral products operating on a shared platform.
- A mature evaluation system with country, language, topic, and risk-specific benchmarks.
- Core teams in London, San Francisco, and Singapore, supported by regional country cells and freelancers.
- Documented privacy, security, business continuity, vendor, and incident controls appropriate for enterprise use.
- Progressive governance with transparent treasury, defined reserved matters, and phased decentralization to regional entities.

18.2 Post-2028 decisions

- Whether further cross-chain expansion beyond the initial audited deployment provides enough user value to justify additional security and compliance risk.
- Whether a broader handover of governance to regional entities is compatible with fiduciary, legal, security, and operational responsibilities.
- Whether to expand from asset-related legal intelligence into broader legal domains.
- Which countries justify full local entities or offices rather than virtual country cells.
- Whether proprietary legal models, licensed data, or acquisitions are needed for defensibility.
- How M48 and later token vesting, treasury, and governance obligations will be managed and reported.

Appendix A - Whitepaper Consistency Notes

Whitepaper statement	Roadmap consistency treatment
Ask -> Understand -> Connect	Used as the core product architecture and release sequence.
40+ jurisdictions	Converted into explicit monitored, indexed, reviewed, production, and professional-network tiers.
Marketing launch, public TGE, OVAX-AI V1	Placed in Q3-Q4 2026, running concurrently with the later part of Phase 1, behind the legal, security, utility, treasury, and market-integrity gates in Section 11.1; dates remain indicative.
AI Risk Briefing	Developed as part of the Q1 2027-Q2 2027 Ecosystem build-out, after retrieval and citation quality are proven.
Cross-chain infrastructure	Deployed from Q1 2028 once participating enterprises satisfy legal, regulatory, and audit requirements; further expansion assessed post-roadmap.
Institutional suite	Mapped to Q1 2028 alpha, maturing through Q3 2028, after enterprise security and API capability mature.
Governance decentralization to regional entities	Reframed as progressive governance with reserved matters and evidence-based phased delegation, beginning with signaling in 2027 and expanding through Q3 2028.
M48 circulating schedule	Acknowledged as extending beyond this roadmap's Q3 2028 end point.

Appendix B - First 90-Day Action Plan

Period	Required action
Weeks 1-2	Confirm company structure, owners, product boundaries, repo controls, release owner, source map, and country editor for Singapore.
Weeks 3-4	Finalize canonical legal schema, editorial form, contributor agreement, review levels, incident labels, and benchmark format.
Weeks 5-6	Import priority Singapore company-law sources; build parser and source validation; create 200 benchmark questions.
Weeks 7-8	Implement hybrid retrieval, citation objects, answer templates, abstention, and source display.
Weeks 9-10	Launch controlled internal review; collect failures; fix source gaps; test privacy and access controls.
Weeks 11-12	Invite controlled beta users; publish research-preview limitations; produce first quality and incident report.

Appendix C - Governance and Review Committees

Committee	Minimum mandate
Release Committee	Approve jurisdiction launches, product releases, claims, major AI changes, and downgrade/rollback decisions.
Legal Data Council	Own schema, source hierarchy, country standards, review policy, and coverage-tier decisions.
Security and Privacy Committee	Own security risk, incident response, access, vendor risk, privacy operations, and enterprise controls.
Token and Treasury Committee	Own allocation reporting, vesting, treasury, audits, utility readiness, and governance proposals.
Professional Network Committee	Own professional verification, referral rules, complaints, conflicts, and network quality.

Final strategic statement

OVAX-AI should scale only when it can preserve trust. The central objective of the 2026-2028 period is to convert the Whitepaper vision into a verifiable legal intelligence operating system: source-grounded, jurisdiction-aware, transparent about limitations, continuously updated, secure, and connected to qualified human expertise - even on an accelerated, overlapping timeline.

Document Disclaimer: This roadmap is a strategic planning document. It is not legal, financial, tax, or investment advice; not an offer or solicitation to purchase tokens or securities; and not a guarantee that any product, token, exchange, governance, staffing, office, revenue, or jurisdiction milestone will occur. Timelines and targets are indicative and must be revised based on legal advice, funding, technical evidence, market demand, security findings, and operational capacity.
